cancer is one of the leading causes of death worldwide significant advances in the understanding of cancer biology have been reported in the last decade many important driving changes especially immunological deregulations are implicated in cancer development and progression these events lead to cancer complexity and heterogeneity in cancer and play a substantial role in pharmacokinetic variability in anticancer therapies furthermore it remains difficult to quantify the prevalence of recurrence and metastasis interestingly omics have shown promising results and are being used to better describe cancer susceptibility prognosis and response to treatment additionally

researchers are still searching for immunological and other cancer signatures particularly relevant for effective cancer prediction emerging data obtained independently are still insufficient to explain the complexity of cancer hopefully new comprehensive systemic and combinatorial approaches will yield benefit in the future and will lead to the development of personalized treatment regimens and improved immunotherapies in this research topic we welcome submissions that propose new panels including and not limited to immunological information cytokines signal transduction pathways involving immune receptors immune tolerance molecules extracellular vesicles immune cells etc genetic information related to genes involved in the deregulation of immune functions eg multi snp cnv medical history imaging results authors should present integrative and systemic approaches using clinical data to make reliable predictions of cancer risk and its prognosis and to support cancer treatment management and clinical decision making
